Security Vulnerabilities

FraktHQ strives to provide the most trustworthy and secure DEFIxNFT utilities on Solana. Finding and eliminating current vulnerabilities is a top priority. FraktHQ highly values our partnership with the vulnerability hunting community and as such we ensure all reports are reviewed by security experts and acted upon appropriately.
Please provide detailed reports with reproducible steps. If the report is not detailed enough to reproduce the issue, the issue will not be eligible for a reward.

The reward for submitting legitimate security vulnerabilities varies based on severity. Once the vulnerability is submitted and confirmed, the FraktHQ team will work with the submitter directly to come to a fair compensation.

Guidelines:

- Do not impact production systems in a negative way for any testing
- All testing and research should be conducted on *testnets.opensea.io*
- Submit one vulnerability per report, unless you need to chain vulnerabilities to provide impact.
- When duplicates occur, we award the first report that was received (provided that it can be fully reproduced).
- Multiple vulnerabilities caused by one underlying issue will be awarded one bounty.
- Social engineering (e.g. phishing, vishing, smishing) is prohibited.
- Avoid privacy violations, destruction of data, and interruption or degradation of our service. Only interact with accounts you own or with explicit permission of the account holder. Please provide detailed reports with reproducible steps. If the report is not detailed enough to reproduce the issue, the issue will not be eligible for a reward.
